GET vs POST

GET	POST
Not secure because data is exposed in URL	Data is not exposed
Idempotent	Non-idempotent
Limited amount of data because data is sent in header	Large amount of data can be sent
Cacheable	Only if freshness information is included

proxy:

網路代理，這種網路服務在客戶端和網站之間扮演中介的角色

flask 教學

<https://hackmd.io/@shaoeChen/HJiZtEngG/https%3A%2F%2Fhackmd.io%2Fs%2FH1CMTVheG>
(<https://hackmd.io/@shaoeChen/HJiZtEngG/https%3A%2F%2Fhackmd.io%2Fs%2FH1CMTVheG>).

Download nginx

```
1  sudo apt update
2  sudo apt install nginx
3
4  sudo ufw app list #列出結果
5  sudo ufw allow 80
6  sudo ufw allow 5000
7  sudo ufw allow 3306
8  sudo ufw status #如果是inactive -> sudo ufw enable
9
10 sudo systemctl restart nginx
11 #if got error:
12 #sudo fuser -k 80/tcp
13 #sudo fuser -k 443/tcp
14 #nginx -t see error-> sudo vim /var/log/nginx/error.log
```

LAB10

修改 nginx

```
sudo vim /etc/nginx/sites-available/default
```

```
server {
    listen 80 default_server;
    listen [::]:80 default_server;

    root /home/q56101078/restful_web;

#    server_name 10.100.100.87, 192.168.84.8;
    location / {
        proxy_pass http://localhost:5000/;
    }
}
```

安裝mysql

- 1 | sudo apt install mysql-server
- 2 | mysql --version # check mysql was successfully installed
- 3 | sudo mysql -u root # login mysql as root

問題

1. #1698

before:

```
# --print-defaults to see which it would actually u
+-----+-----+
| user          | plugin          |
+-----+-----+
| debian-sys-maint | caching_sha2_password |
| mysql.infoschema | caching_sha2_password |
| mysql.session   | caching_sha2_password |
| mysql.sys       | caching_sha2_password |
| root           | auth_socket      |
+-----+-----+
5 rows in set (0.00 sec)
```

after:

```
mysql> use mysql;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
mysql> select user,host,plugin from mysql.user;
+-----+-----+-----+
| user          | host      | plugin                |
+-----+-----+-----+
| debian-sys-maint | localhost | caching_sha2_password |
| mysql.infoschema | localhost | caching_sha2_password |
| mysql.session   | localhost | caching_sha2_password |
| mysql.sys       | localhost | caching_sha2_password |
| root           | localhost | mysql_native_password |
+-----+-----+-----+
5 rows in set (0.00 sec)
```

```
sudo vim /etc/mysql/mysql.conf.d/mysqld.cnf
```

```
1 skip-grant-tables #在[mysqld]增加
2 #進入mysql
3 sudo mysql -u root
4 > use mysql;
5 > update user set plugin='mysql_native_password' where user='root';
6 > flush privileges;
7 > exit;
8
9 sudo service mysql restart
```

2. #2003

```
1 sudo vim /etc/mysql/mysql.cnf
2 sudo vim /etc/mysql/mysql.conf.d/mysqld.conf
3
4 sudo systemctl restart mysql
5 sudo systemctl restart mysqld
```

```

[mysqld]
#
# * Basic Settings
#
user                = mysql
# pid-file           = /var/run/mysqld/mysqld.pid
# socket              = /var/run/mysqld/mysqld.sock
port                = 3306
# datadir             = /var/lib/mysql
skip-grant-tables

# If MySQL is running as a replication slave
# changed. Ref https://dev.mysql.com/doc/ref
es.html#sysvar_tmpdir
# tmpdir              = /tmp
#
# Instead of skip-networking the default is
# localhost which is more compatible and is
bind-address         = 10.100.100.87
mysqlx-bind-address  = 127.0.0.1
#

```

下面兩行註解調

安裝 python

```

1  sudo apt-get update
2  sudo apt-get upgrade
3  sudo add-apt-repository ppa:deadsnakes/ppa
4  sudo apt-get install python3.7
5
6  python3 main.py # 運行程式

```

參考:Build Simple RESTful API using Python and MySQL (<https://techarise.com/restful-api-using-python-mysql/>).

參考:Build Simple RESTful API using Python and MySQL2 (<https://techarise.com/restful-api-using-python-mysql/>).

參考:Flask實作 (<https://hackmd.io/@shaoeChen/HJiZtEngG/https%3A%2F%2Fhackmd.io%2Fs%2FBk2QpUAlG>).

執行

```
1
2 curl -X POST http://10.100.100.87:5000/key -H 'Content-Type: application/json' -
3 curl -X GET http://10.100.100.87:5000/key -H 'Content-Type: application/json' #2
4 curl -X GET http://10.100.100.87:5000/key/111q -H 'Content-Type: application/jsc
5 curl -X PUT http://10.100.100.87:5000/key/111 -H 'Content-Type: application/json
6
7 curl -X DELETE http://10.100.100.87:5000/key/111
8     -H "Accept: application/json" #5
```

sql 語法

```
1 desc <table_name>; /*看schema*/
2
3 create database <name>;
4 drop database <name>;
```

需求

1. **POST /key**: 新增一個 key-value pair

a. Request body 須包含 key 和 value 的值，Ex:

```
{
  "key": "key1",
  "value": "data1"
}
```

b. 資源成功創建須回傳 201，若 key 已存在則回傳 400 (key 須為唯一)。

2. **GET /key**: 回傳 database 中所有的 key (不用回傳 value)

a. Response 為 array，包含 database 中所有的 key，Ex:

```
[
  "key1",
  "key2"
]
```

b. 回傳 200 狀態

3. **GET /key/{key}**: 回傳 database 中指定的 key 的資訊

a. Request，Ex: **curl http://<YOUR_IP>/key/key1**

b. Response，Ex:

```
{
  "key1": "data1"
}
```

c. 成功則回傳 200，若找不到對應的 key 就回傳 404

4. **PUT /key/{key}**: 更新指定的 key 的 value

a. Request body 須包含 value 的值，Ex:

```
{
  "value": "updated_data1"
}
```

b. 因為是 PUT，所以 key 不存在時會創建新的 key-value pair，請回傳 201。若 key 已存在，則更新 value 並回傳 200。

5. **DELETE /key/{key}**: 刪除指定的 key

a. Request，Ex: **curl -X DELETE http://<YOUR_IP>/key/key1**

b. 回傳 200

RESTFUL API

```
----restful_web
|--app.py
|--config.py # mysql 連線方式
|--main.py #restful api
```

app

```
1 from flask import Flask
2 from flask_cors import CORS, cross_origin
3
4 app=Flask(__name__)
5 CORS(app)
```

config

```
1 from app import app
2 from flaskext.mysql import MySQL
3
4 mysql = MySQL()
5 app.config['MYSQL_DATABASE_USER'] = 'root'
6 app.config['MYSQL_DATABASE_PASSWORD'] = ''
7 app.config['MYSQL_DATABASE_DB'] = 'restful'
8 app.config['MYSQL_DATABASE_HOST'] = 'localhost'
9 mysql.init_app(app)
```

main

```
